

Famous Celebrity is Dying Due to EBV; The CBCD Reviews a Report

The National Enquirer claims that Cher is “fading fast” due to infection with the Epstein-Barr Virus. (1)

ROCHESTER, NY, UNITED STATES,
November 23, 2015 /EINPresswire.com/
--

“Infected with the Epstein-Barr Virus (EBV)? The CBCD recommends taking [Gene-Eden-VIR](#) or [Novirin](#).” – Greg Bennett, CBCD

According to a report, mega-celebrity, Cher has been battling an infection with the Epstein-Barr Virus (EBV) since the early 1980’s. However, recently the star was reported to be heading to Germany “to receive treatment for some sort of ‘killer virus.’ While Cher said that she was in Europe for work, a source said that she was receiving stem cell replacement therapy that is not available in the U.S. (likely meaning it’s not FDA approved).” (1) The National Enquirer quoted a “source” who said that ‘Cher is fading fast. There’s no hope for her. Going to Germany was really a Hail Mary pass to find some sort of ‘miracle cure’ for the virus that’s killing her. Time is running out, and Cher is very aware of it. But she doesn’t want anyone to know exactly how dire her health condition is. So, she covered up the whole thing in a tweet to her fans.’” (1)

While the Center for the Biology of Chronic Disease (CBCD) does not have first hand information regarding Cher’s

health, the Center reminds the public that the EBV is responsible for infectious viral mononucleosis. The virus has also been linked to a number of cancers.

In fact, EBV is very common. “EBV infects B and T lymphocytes of more than 90% of the general population before adulthood. Primary infection results in

of cancers.

EBV infection has two phases, acute/reactivation and latency. During the latent phase, the virus continues to replicate on a small scale, and produces only some of its proteins.

The Center for the Biology of Chronic Disease (CBCD) recommends that in light of the medical evidence, individuals concerned about infection with the latent EBV take Gene-Eden-VIR or Novirin. The formula of these natural, antiviral supplements was designed to help the immune system target the latent form of the Epstein-Barr Virus.

The formula of Gene-Eden-VIR and Novirin was tested by Hanan Polansky and Edan Itzkovitz from the CBCD in two clinical studies that followed FDA guidelines. The studies showed that the Novirin formula is effective against the herpes family of viruses. The Epstein Barr Virus (EBV) is a member of the herpes family. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, "individuals infected with the EBV ... reported a safe decrease in their symptoms following treatment with (the formula of Novirin)." (3) The study authors also wrote that, "We observed a statistically significant decrease in the severity, duration, and frequency of symptoms." (3)

Gene-Eden-VIR and Novirin can be ordered online on their respective websites, here:

<http://www.gene-eden-vir.com>

and

<http://www.novirin.com>

Gene-Eden-VIR and Novirin are natural antiviral dietary supplements. Their shared formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses. To date, Gene-Eden-VIR and Novirin are the only natural antiviral products on the market with published clinical studies that support their claims.

"The virus can reactivate in a person who hasn't shown symptoms for years ... (but) ... Cher really downplayed the whole thing ... she climbed off her 'death bed' to head to Germany." (1) The article, which described Cher's alleged condition suggested that the treatment for EBV infection was merely drinking lots of water and getting rest. However, this is not the case.

What treatments are available for EBV infections?

"A few antiviral drugs are available that were shown to inhibit EBV replication in cell culture. These drugs include the acyclic nucleoside analogues aciclovir, ganciclovir, penciclovir, and their respective prodrugs valaciclovir, valganciclovir and famciclovir, the acyclic nucleotide analogues cidofovir and adefovir, and the pyrophosphate analogue foscarnet. However, clinical studies have shown that these drugs are mostly ineffective in humans." (3) There are also natural antiviral products that studies show to be safe and effective in reducing EBV symptoms. Two of these products are Novirin and Gene-Eden-VIR.

“Based on the results of the CBCD’s research, we recommend that individuals infected with the latent virus take Gene-Eden-VIR or Novirin.” - Greg Bennett, CBCD
