

# HPV: Do Condoms Prevent Infection?; The CBCD Answers a Survey Question

*The short answer is “no.” HPV can be transmitted through any skin-to-skin contact.*

ROCHESTER, NY, UNITED STATES,  
November 23, 2015 /EINPresswire.com/

“Infected with the human papillomavirus (HPV)? We recommend taking [Gene-Eden-VIR](#) or [Novirin](#).” – Greg Bennett, CBCD

The Center for the Biology of Chronic Disease (CBCD)'s October 2015 survey found that almost 86% of participants had the false belief that if a couple uses a condom, transmission of the human papillomavirus (HPV) from one partner to the other is prevented. However, this is a false belief. The truth is, “condoms only cover so much of the genital area and since HPV is transmitted via skin-to-skin contact, any genital contact is fair game for transmission. With that said, condoms can lower risk of transmission of HPV and other STDs, so you should absolutely still use them, but they're no guarantee either.” (1) This is true, whether there are visible signs of an infection, such as with genital warts, or not, as in the case of high risk (cancer causing) HPV strains.

Sometimes it can take years after an infection with the human papillomavirus (HPV) before an individual develops any kind of symptoms. Even if the person does develop symptoms, the genital warts may develop inside the vagina, or inside the anus where a person cannot see them. If a person suspects that they have developed genital warts, they should see a doctor immediately to get an accurate diagnosis. It should be noted that “the most common places for warts to develop in women are: around the vulva (the opening of the vagina), on the cervix (the entrance to the womb), inside the

vagina, around or inside the anus, on the upper thighs. And in men: on the penis, on the scrotum, inside the urethra, (the tube that urine flows through), around or inside the anus.

The Center for the Biology of Chronic Disease (CBCD) recommends that anyone who may be concerned about an HPV infection, which can cause genital warts and other symptoms, take Gene-Eden-VIR or Novirin. The formula of these natural, antiviral products was shown to reduce symptoms associated with HPV infection in two separate post-marketing clinical studies that followed FDA guidelines. Additionally, it was designed to help the immune system target the latent HPV.

The formula of these natural antiviral products was tested by Hanan Polansky and Edan Itzkovitz from the CBCD in two clinical studies that followed FDA guidelines. The studies showed that the Novirin and Gene-Eden-VIR formula is effective against the HPV and other viruses. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, "individuals infected with the HPV...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR." (3) The study authors also wrote that "we observed a statistically significant decrease in the severity, duration, and frequency of symptoms." (3)

Both products can be ordered online on the Novirin and Gene-Eden-VIR websites here:

<http://www.novirin.com>

and

<http://www.gene-eden-vir.com>

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses. To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims.

Note: Novirin has the same formula as Gene-Eden-VIR. However, it contains higher quality and more expensive ingredients.

"Most people who are infected with genital HPV never know it; their virus does not call attention to itself in any way. In most cases, a person is diagnosed with HPV only because some troubling symptom drove him or her to a health care professional, or some abnormality was revealed in the course of a routine exam." (1) Additionally, immunize.org notes that "For people who are sexually active, a long-term, mutually monogamous relationship with an uninfected partner is the strategy most likely to prevent future genital HPV infections. However, it is difficult to determine whether a partner who has been sexually active with another partner in the past is currently infected." (4)

Avert.org recommends that anyone who suspects that he or she has developed genital warts should see a doctor right away. That individual should never try to diagnose his or herself. (2)

What Current Treatments are Available for HPV infections?

"There are no drugs approved against the HPV. Current treatments include procedures, such as

cryotherapy, conization, and the Loop Electrosurgical Excision Procedure (LEEP). These procedures use liquid nitrogen, a surgical knife (scalpel), a carbon dioxide (CO2) laser, or electrical current to remove the abnormal growths caused by the HPV. These growths include cells that harbor the active virus. The procedures do not target cells with the latent virus. Since they do not remove the latent virus, these procedures only produce a temporary remission.” (3) In contrast, Novirin and Gene-Eden-VIR were designed to target the latent HPV, and were shown to reduce HPV symptoms in two separate post-marketing clinical studies that followed FDA guidelines.

The CBCD therefore recommends that HPV infected individuals take Novirin or Gene-Eden-VIR.
