Dental burs and endodontic files are tools used in modern dentistry for tooth restoration and surgical care. Burs are designed as tiny drilling equipment to cut hard tissues, including tooth. Both burs and endodontic files are made of steel, stainless steel, tungsten carbide, and diamond grit. Burs are attached to a handpiece and hold a cutting blade, which help to provide a smooth surface while preparing cavities. Endodontics is the field of dentistry that deals with the treatment of dental pulp and the tissues surrounding the roots of the teeth. It involves various procedures such as root canal therapy, endodontic retreatment, surgery, treating cracked teeth, and treating dental trauma. Additionally, these tools help to clean and shape the root canal.

The burs and endodontic files market is segmented on the basis of type, end-user, and geography. The market, by geography, is broadly segmented into North America, Europe, Asia Pacific, the Middle East & Africa, and South & Central America. The report offers insights and in-depth analysis of the market, emphasizing parameters such as market trends, technological advancements, and market dynamics, along with the analysis of the competitive landscape of the globally leading market players.

Rising Dental Disease Prevalence to Drive Burs and Endodontic Files Market Growth during Forecast Periods

According to a report published by the Global Burden of Diseases Study in September 2018, oral diseases have affected ~3.58 billion people worldwide, and dental caries is among the most common dental illnesses. Dental caries, which may further lead to tooth loss, has affected ~2.3 billion people and more than ~530 million children globally. Moreover, various dental conditions further lead to tooth loss, root canal, dry mouth, cavities, biting difficulties, and so on. Thus, the increasing prevalence of such dental conditions boosts the growth of the global burs and endodontic files market. As per the World Health Organization (WHO), ~60–90% of children and ~100% of adults in the world have dental cavities. Moreover, according to the American College of Prosthodontists (ACP), 178 million Americans have lost at least one tooth. On average, 40 million people in the US are suffering from tooth decay problems, and this number is expected to rise in the next two decades owing to the increasing occurrence of cavities and tooth decay among people. According to the American Association of Endodontics, over 15 million root canals are performed every year, while more than 41,000 root canals are performed every day in the country. These factors are expected to fuel the demand for burs and endodontic files. With nearly 33,000 cases per 100,000 inhabitants, caries is also the most prevalent condition in Germany. Recently, it has been reported that across England as a whole, 23% of five-year-olds have had dental decay, the same is rising to 34% in deprived areas and falling to 14% in wealthier communities.

COVID-19 first began in Wuhan (China) during December 2019 and since then it has spread at a fast pace across the globe. The US, India, Brazil, Russia, France, the UK, Turkey, Italy, and Spain

are some of the worst affected countries in terms confirmed cases and reported deaths. The COVID-19 has been affecting economies and industries in various countries due to lockdowns, travel bans, and business shutdowns.
