About Panther Minerals Inc.

Panther Minerals Inc. is a mineral exploration company actively involved in the exploration of its North American project portfolio.

<https://pantherminerals.ca/>

Boulder Creek Deposit

Discovered in 1977 in western Alaska, by means of airborne radiometric data, Boulder Creek is the most northerly known sandstone-type property in the world which may host Uranium

First explored by Houston Oil & Minerals between 1979 and 1981 – completing 52 core holes (3,463 m) and about 60 m of near-surface split-tube sampling in 21 holes <sup>1</sup>

Lastly explored by Triex Minerals between 2006-8 – completing 22 core holes (2,217m) + Historical Geochem, airborne radiometric data and surface prospecting <sup>2</sup>

Boulder Creek has a historic resource estimate (non-National Instrument 43-101 compliant) of one million pounds U3O8 at an average grade of 0.27 per cent and average thickness of three metres and depth of mineralization from surface to 120 metres.

The foregoing is a historical estimate made prior to the implementation of National Instrument 43-101 — Standards of Disclosure for Mineral Projects and was not prepared in accordance with the requirements of NI 43-101, nor does it use the categories of mineral resources set forth in NI 43-101.

District Scale Expansion

Significantly enlarged Boulder Creek Uranium property now comprising 9,065 Ha – extending North Northwest – South Southeast for approximately 30 KMs and between 3 to 7Km in width

Strategic expansion to include prospective Fireweed target discovered due to strong airborne

radiometric anomalies <sup>1</sup>

Significant potential for discoveries on largely unexplored project
