Looking forward, it's predicted that the cervical cancer drugs market will see uninterrupted growth with a projected market value of \$30.77 billion by 2028 at a CAGR of 4.9%. This growth in the forecast period will be mostly driven by advancements in immunotherapy, expansion of precision medicine, continued development of targeted therapies, and increased HPV

vaccination programs. Additionally, innovative combination therapies are expected to play an integral role.

What's Driving The Growth of The Cervical Cancer Drugs Market?

An important market driver is the increasing prevalence of HIV in women. Unfortunately, women who are HIV positive are at a higher risk of developing cervical cancer than their counterparts in the general population. Globally, almost 18 million women have tested positive for HIV. This virus weakens the immune system, and as a result, it increases the likelihood of cervical cancer. Given these circumstances, women living with HIV have a higher chance of being diagnosed with cervical cancer due to the decrease in the count of the protein CD4. As a result, a person with HIV is three times as likely to be diagnosed with cervical cancer, according to a survey by the National Cancer Institute. This rising trend has inevitably contributed to the growth of the cervical cancer drugs market.

A first-hand look at key market trends is available here:
