Advanced Quality Management System

In today's high-stakes regulatory environment, maintaining transparency, traceability, and efficiency is critical for businesses, especially in pharmaceuticals, healthcare, manufacturing, and other highly regulated sectors. AQMS is purpose-built to reduce operational bottlenecks, prevent costly compliance failures, and support continuous quality improvement, all while meeting international standards such as FDA 21 CFR Part 11 and EU Annex 11.

Addressing Real-World Challenges with Smart Technology

AQMS goes beyond traditional quality management tools by offering intelligent, modular features that simplify complex quality workflows. It empowers QA teams and regulatory professionals to act proactively instead of reactively, significantly reducing risks associated with manual processes and fragmented systems.

Key Modules Include:

- Deviation Management: Capture deviations in real time and trigger built-in root cause analysis. Track closures efficiently to minimize recurring issues and accelerate resolution timelines. This module enables organizations to proactively manage quality events before they escalate.
- CAPA Automation: Streamline the entire lifecycle of corrective and preventive actions. From recording to investigation and closure, every step is automated to ensure timely resolution, proper documentation, accountability, and compliance with quality standards.
- Audit Management: Simplify both internal and external audits through structured planning, seamless scheduling, execution control, and organized follow-ups. Each audit is backed by a tamper-proof audit trail, ensuring transparency and adherence to regulatory requirements.
- Change Control: Manage organizational and process-level changes with configurable approval workflows, detailed impact assessments, and effective cross-functional collaboration. This reduces risks, prevents unauthorized modifications, and ensures a smooth transition for every approved change.
- Maintenance and Instrument Management: Efficiently manage ongoing and preventive maintenance activities, including continuous qualifications and calibration routines. The system automates the entire maintenance cycle and prompts users when instruments are due for servicing, helping ensure equipment readiness and compliance with operational standards.
- Archival: Securely store vital project and system documents in digital and physical archives with designated compactors and shelves for ease of pulling them when needed. Every document is barcoded for traceability. The system provides full control over document retrieval and access based on barcode identification, followed by systematic and authorized destruction as per policy.
- Regulatory Readiness: Complies with global regulations by offering eSignatures, time-stamped logs, data integrity safeguards, and validation-ready architecture.

Driving Compliance, Efficiency, and Growth

"AQMS is not just a tool—it's a strategic enabler for companies aiming to scale with confidence while maintaining strict compliance standards," said Aakash Goyal, Co-Founder at Cloudestar Software. "We've designed AQMS to solve the real pain points of quality teams, helping them transition from paper-based or semi-digital processes to a fully integrated digital ecosystem."
